

PRD: FlowZint Support Workflow Assistant

1) Product summary

FlowZint publicly positions itself as a company building enterprise digital infrastructure, SaaS systems, AI automation, and enterprise systems for scalable operations. Its site structure also exposes business enquiry, partnership, careers, internship programs, open opportunities, hiring process, and contact information as first-class paths. That makes a generic FAQ bot the wrong product; the bot should be a workflow-oriented assistant that routes these intents, answers from official FlowZint content, and converts conversations into structured actions. ([FlowZint](#))

2) Product goal

Build a secure, lightweight support assistant that helps visitors and applicants get accurate answers from FlowZint's own public information, while also generating internal, structured handoffs for the FlowZint team. The bot should support three outcomes: answer questions, qualify the request, and trigger the correct next workflow. This fits FlowZint's emphasis on operational clarity, intelligent automation, workflow optimization, and connected systems. ([FlowZint](#))

3) What the bot should do for FlowZint

The bot should primarily handle these intent buckets, inferred from the site's own navigation and contact structure: business enquiries, partnership, contact information, careers, internship programs, open opportunities, hiring process, and service questions around AI & Automation, SaaS Systems, Enterprise Systems, Web Infrastructure, Mobile Platforms, and Branding & Growth. That is the most faithful way to design a bot for this company because the site clearly organizes itself around those categories. ([FlowZint](#))

Intended user groups

- Prospective clients asking about services.
 - Potential partners.
 - Candidates and interns.
 - Existing visitors looking for contact or company information.
 - Hackathon judges evaluating how well the bot fits FlowZint's automation identity.
- ([FlowZint](#))

4) Core product principle

Do not build a chatbot that just talks. Build a bot that:

1. identifies the user's intent,
2. answers only from official sources,
3. structures the request,
4. routes it to the right internal action.

That aligns with FlowZint's repeated focus on connected functionality, intelligent integration, operational visibility, and workflow coordination. ([FlowZint](#))

5) MVP scope

In scope

- Website chat widget.
- Intent detection.
- Retrieval from FlowZint pages and uploaded company docs.
- Structured response generation.
- Handoff queue for business enquiries, partnerships, and careers.
- Simple admin dashboard showing requests and status.
- Escalation when confidence is low.

Out of scope for MVP

- Voice support.
- Omnichannel messaging.
- CRM replacement.
- Deep analytics dashboard.
- Fully autonomous execution across many external systems.

This scope is appropriate because FlowZint's public pages emphasize scalable systems, workflow automation, and connected operations rather than one-off consumer chat. ([FlowZint](#))

6) Functional requirements

A. Intent router

The bot must classify each message into one of the main FlowZint paths:

- Business enquiry
- Partnership

- Contact information
- Careers
- Internship programs
- Open opportunities
- Hiring process
- Service inquiry

B. Knowledge-grounded answers

The bot must answer from:

- FlowZint homepage
- About page
- AI & Automation page
- Enterprise Systems page
- any uploaded official documents

C. Structured output

For each request, the bot should generate a short internal record:

- intent
- summary
- urgency
- contact details if shared
- recommended next action
- confidence score

D. Workflow handoff

If the request is business-related, the bot should create a clean handoff for the team instead of merely replying.

E. Fallback

If the bot is uncertain, it should say so and route to human review rather than invent an answer.

These requirements follow directly from the way FlowZint describes itself around operational clarity, intelligent automation, connected ecosystems, and enterprise systems. ([FlowZint](#))

7) Suggested user journeys

Journey 1: Business enquiry

User asks about AI automation services.

Bot identifies the AI & Automation intent, summarizes the need, answers from the official site, and creates an internal lead card. FlowZint's site explicitly describes AI systems for workflow automation, intelligent coordination, and predictive operational value, so this route is a natural fit. ([FlowZint](#))

Journey 2: Career or internship query

User asks about internships or hiring.

Bot answers from the careers-related site structure, collects basic details, and queues the request. The homepage already exposes Careers, Internship Programs, Open Opportunities, and Hiring Process as first-class sections. ([FlowZint](#))

Journey 3: Partnership query

User asks about collaboration.

Bot summarizes the request, extracts company name and goal, and prepares a partnership handoff. The homepage explicitly lists Partnership under Contact. ([FlowZint](#))

8) Product architecture

Recommended architecture

- Frontend chat UI
- Backend API
- Retrieval layer over official content
- Structured JSON generation layer
- Handoff queue / admin panel
- Local storage for messages and request status

FlowZint's own pages repeatedly emphasize layered systems, connected infrastructure, and modular enterprise architecture, so a clean layered design is the right match. ([FlowZint](#))

9) Final MVP behavior

The final MVP should demonstrate this sequence:

User question → intent classification → grounded answer → structured summary → internal handoff.

That is enough to show FlowZint-style operational intelligence without overbuilding. The AI & Automation and Enterprise Systems pages both stress workflow optimization, operational

visibility, intelligent integration, and long-term scalability, which makes this the most defensible shape for the product. ([FlowZint](#))

10) Zero-cost tool stack

Frontend

- React
- TypeScript
- Vite

React is a component-based library for web interfaces. TypeScript adds typed JavaScript with better tooling. Vite is a fast development build tool for modern web projects with an opinionated default setup and React templates. ([React](#))

Backend

- FastAPI
- Python

FastAPI describes itself as a high-performance, easy-to-learn, fast-to-code framework ready for production, which makes it suitable for a hackathon backend. ([FastAPI](#))

Retrieval

- Chroma, running locally

Chroma is open-source AI data infrastructure for retrieval. Its docs say it supports embeddings, dense and sparse vector search, metadata filtering, and local self-hosting. That makes it a strong zero-cost choice for answering from FlowZint's own pages and docs. ([Chroma Docs](#))

LLM

- Ollama with a small local open model

Ollama says your data stays yours and that models can run entirely offline for mission-critical work. That is the safest zero-cost path for a hackathon demo that should not depend on paid APIs. ([Ollama](#))

Storage

- SQLite for MVP

SQLite describes itself as small, fast, self-contained, high-reliability, and full-featured. That is enough for chat logs, intents, and request tracking in the MVP. ([SQLite](#))

CI/CD

- GitHub Actions

GitHub Actions lets you automate and customize workflows directly in your repository, which is sufficient for basic testing and deployment automation. ([GitHub Docs](#))

11) Feature roadmap

Phase 1: Must-have

- Chat UI
- Intent classification
- Grounded answers from FlowZint pages
- Basic request logging
- Human fallback

Phase 2: Stronger product value

- Business enquiry form generation
- Career and internship routing
- Partnership routing
- Short structured summaries for the team

Phase 3: Differentiation

- Smart prioritization
- Duplicate request grouping
- Simple analytics dashboard
- Suggested next action

Phase 4: Optional stretch

- Automatic email drafting
- Slack or Discord notification
- Lead scoring for business enquiries

This phased approach matches FlowZint's own messaging around operational value, workflow automation, scalability, and long-term maintainability. ([FlowZint](#))

12) Success metrics

The MVP should be judged by:

- answer accuracy from official content
- correct intent classification
- percentage of requests routed correctly
- time to generate a structured handoff
- number of human corrections needed
- quality of business enquiry summaries

13) Risks and mitigations

- Hallucination risk: use retrieval-first responses and force fallback when confidence is low.
- Wrong routing: keep intents simple and visible.
- Overautomation: always provide a human escalation path.
- Scope creep: keep the first version limited to FlowZint's public content and key contact paths.

These mitigations are consistent with FlowZint's stated emphasis on operational reliability, adaptive systems, and maintainable infrastructure. ([FlowZint](#))

14) Recommended product name

FlowZint Support Workflow Assistant

A more productized alternative:

FlowZint AI Concierge

The first name is stronger if you want to emphasize workflow routing and internal handoff. The second is better if you want a friendlier website-facing brand.

15) Final recommendation

For FlowZint, the support bot should be a **workflow assistant for enquiries, hiring, and partnerships**, not a generic support chatbot. It should answer from official FlowZint content, route requests into structured next actions, and demonstrate the company's own themes: intelligent automation, enterprise systems, operational clarity, and connected workflows. That is the cleanest fit with what FlowZint publicly says it builds. ([FlowZint](#))
